The Key to Atomizing successful Results is knowledge of the techniques of Conventional and Atomic Air Blasting and Gun Blasting and the Power of Atomization and Air Blasting. Back to Contents Conventional and Atomic Air Blasting and Gun Blasting This manual has been produced with the expectation that the reader will be familiar with a certain amount of conventional blasting and blasting with compressed air. Conventional Blasting The production of any construction related to rock excavation may be defined as a conventional blasting operation. Typically, a conventional blast operation is used to remove obstacles in pre-existing underground building sites or for the excavation of shallow pits or holes for construction. As used in this document, a conventional blasting operation is used to refer to a blasting operation where the explosive is fired into the "rough-cut" face of a rock or rock formation. Firing into the "rough-cut" face of a rock or rock formation is commonly referred to as "face blasting." Typical face blasting rock faces are loose soil, gravel, clay, and sandstone rock. Face blasting with explosives is a relatively simple operation, even though the success of the operation can be seriously hampered by misinformation. In fact, some conventional blasting using explosives is so unsafe that it should never be attempted. This Manual is an attempt to present the basic fundamentals of blasting for safety and practical success. However, neither this manual nor any other manual can replace on-site training and experience. For that reason, the reader should not attempt face blasting without proper training and experience. This document does not provide any safety precautions, only basic principles and instructions on proper blasting technique. The preferred blasting method is tunnel blasting to be used for blasting in the vicinity of a tunnel or passageway. Face blasting is usually a technique used to accomplish rock removal with open face or high angle blasting. Face blasting can be a simpler blasting operation than tunnel blasting because of its one-way advantage. Although there are some advantages to face blasting, there are also some drawbacks, The greatest drawback to conventional face blasting
